

# Aggregation Switch igmp

## Overview

The Aggregation Switch has a 160 Gb/s switching capacity with a 119.04 Mpps forwarding rate, features steel construction with a fanless design, and can be rack mounted using the included kit. With features such as Static Routing, DHCP Server, ACL, IGMP Snooping, STP, LAG, and centralized cloud management, they offer a robust and reliable solution for the aggregation layer of SMB networks. Select models. Internet Group Management Protocol (IGMP) is used to dynamically register individual hosts in a multicast group on a particular LAN segment. Enabling Protocol Independent Multicast (PIM) on an interface also enables IGMP operation on that interface. This module describes ways to customize IGMP. The GWN7830 Series of Layer 3 Aggregation Network Switches offers 3 model options, with up to 24 SFP ports and 12 SFP+ ports, which are ideal for medium-to-large businesses and enterprises that require high-performance networks with maximum capacity and control. AV integrators and network administrators are looking for a quick and simple automated way to configure multiple switches at the same time. Configuring Ethernet trunks, LAG, and IGMP have become tedious and complicated for some non-IT. An aggregation switch is a network device that consolidates traffic from multiple access switches, wireless access points, or other edge devices and forwards it to core switches or routers. **△ IMPORTANT: Ports require SFP+ modules (sold separately). For RJ45 (copper) connections, you MUST use compatible 10G SFP+ to.**
