

Fiber optic cable twisting is substandard

Overview

Bending or twisting an optical cable can cause signal loss, cable loss, and potential data errors or transmission failure. This damage can take several forms, including micro-bending, macro-bending, and stress-induced attenuation. Micro-bending occurs when the fiber is bent at a small radius, typically less than a few millimeters. However, these cables are not immune to external influences that can affect their performance and. In the exploratory Fiber Optic (FO) cables used in the Atlanta Fiberguide System Experiment, 12 optical fiber ribbons each containing 12 fibers are stacked one on top of the other to form a rectangular array of 144 optical fibers. 1-2 Figure 1 shows a representative cross section of a fiber ribbon. □ Fiber design and transmission technology have collaboratively evolved to increase bandwidth. While a small percentage, we can examine the “intrinsic” cable failures and what is done to prevent. els on a variety of high performance synthetic fibers.
