

High UW value of optical power meter

Overview

The best way to solve/avoid this problem is to try disconnecting/ reconnecting the fiber (when you need to do so) at some location than the fiber adapter on the sensor (either at the laser end, or any other connections along the way between the laser and the sensor if there are any). While optical power meters are the primary power measurement instrument, optical loss test sets (OLTSS) and optical time domain reflectometers (OTDRs) also measure power in testing loss. TIA standard test FOTP-95 covers the measurement of optical power. The term "optical power meter" may sound generic, but in popular usage, it specifically implies a fiber optic power meter. Newport's 1936/2936-R Series Optical Power Meters are among the most versatile power meters in the market, and the. We recently came across an interesting customer problem, in which every time he disconnected the Fiber Optics connector from the adapter (that is mounted on the sensor) and then reconnected it, the power read about 50-100 uW higher than it did (nothing else changed). It then took about 10 minutes.

Optical power meters usually display time-averaged power. So for pulse measurements, the signal duty cycle must be known to calculate the peak power value. However, the instantaneous peak power must be less than the maximum meter reading, or the detector may saturate, resulting in wrong average readings. Also, at low pulse repetition rates, some meters with data or tone detection may produce improper or no readings. A class of "high power" meters has some type of optical attenuating element
