

# How are the wires in a distribution box coded

## Overview

IEC 60446 applies to all electrical installations, including: It standardizes color codes, symbols, and labeling methods for terminals, conductors, and cables, ensuring consistency and clarity worldwide. Terminals must be labeled by function (e., input/output), polarity . The wiring color codes are the standard safety language of electricity. They make it easy to identify immediately which wires are live, neutral, or grounded (avoiding costly mistakes and hazardous accidents). This guide describes wiring color codes, international standards, and main rules to keep. The IEC 60446 standard, “Basic and Safety Principles for Man-Machine Interface, Marking, and Identification,” establishes global guidelines for identifying electrical equipment terminals, conductors, and wiring colors. The distinction between 1P and 2P circuit breakers plays a pivotal role in determining the appropriate protection level for various circuits. It serves as a central hub for distributing electricity throughout a building, ensuring that power is delivered safely and efficiently to all the required locations. Wires inside an NM (Non-Metallic) sheathed cable are color-coded. If the conduit size is not given on the drawings, the conduit shall be sized in accordance with NEC based on the number of conductors enclosed plus a parity-sized.
