

How to expand capacity when there aren't enough optical splitters

Overview

Cascade splitting is suitable for high-rise residential buildings with fewer users or multi-story residential buildings with fewer units. In order to improve port utilization, it is recommended to use the system stacking method of different PON ports to expand capacity instead of. A splitter is not a filter like a wavelength division multiplexer (WDM). Typically, but not always, there is one input in and multiple outputs. Light power goes in and light power coming out of the various legs is reduced in. By dividing a single optical signal from a central Optical Line Terminal (OLT) into multiple outputs for Optical Network Terminals (ONTs) at users' homes, splitters eliminate the need for dedicated fibers to each residence—slashing infrastructure costs while scaling network reach. Traditional GPON networks often employ 1:32 or 1:64 splits. It all begins with selecting the right optical splitter: The two main types are PLC (Planar Lightwave Circuit) splitters and FBT (Fused Biconical Taper) splitters.
