

How to route fiber optic cables for high-voltage power lines

Overview

This technique takes a small, lightweight fiber optic cable and wraps it around or lashes it to the power line. The cable is called optical power attached cable (OPAC), and it is lashed to the power cable with a specialized tool that is pulled from the ground, such as a. bles in a high voltage environment, with typical line voltages of 115 kV or more, requires the evaluation of certain critical parameters. Currently, there are a limited number of industry documents that address the requirements for optical fiber cables near high voltage circuits. One standard that. Most aerial fiber optic cables are installed by lashing to a steel messenger wire strung between poles, but there is a category of cables with special high-strength jacket designs called all-dielectric self-supporting (ADSS) cables.
