

OLT connected to two core switches

Overview

The OLT serves as the starting point of a PON, connecting to the core switch via an Ethernet cable. A Gigabit passive optical network (GPON) topology consists of an optical line termination (OLT) device that is connected to multiple optical network terminals (ONTs) through an optical splitter. Downstream traffic is the traffic flowing from an OLT to a specific ONT. Below is a detailed breakdown: OLT is the core device in PON (Passive Optical Network) systems, connecting. In the age of fiber-to-the-home (FTTH) and ultra-broadband connectivity, the Optical Line Terminal - or OLT - is one of the most crucial devices powering our high-speed digital world. When you stream a 4K video, join a remote meeting, or play an online game on a gigabit fiber connection, an OLT. This Article Applies to All GPON OLT Products and all Omada Switches with optical ports. Application Scenario An apartment wants to use the XM60A to enable Omada equipment to access the OLT for networking and flexible deployment.
