

# Optical cables come in both rigid and flexible types

## Overview

Aside from Single Mode and Multimode, fiber optic cables come in a range of configurations, each designed for specific applications. They ensure high-speed data transmission over long distances with minimal loss. Unlike traditional copper cables that use electrical signals, optical cables transmit data via light pulses, offering faster and more reliable. The shift from traditional branch cables to flexible fiber optic cables represents a significant step forward in telecommunications infrastructure. Especially noteworthy is the. Our DryBlock® cable, for instance, is highly durable and flexible, making it ideal for outside plant (OSP) applications, including duct, direct-buried, and lashed aerial installations in harsh environments. Featuring corrugated steel armor and a polyethylene jacket, this cable provides rugged.
