Overview

Passive Optical Network (PON) is a point-to-multipoint optical access technology. It uses only optical fibers to transmit data, voice, and video services. Explore our PON network devices, including OLTs, ONTs, xWDM/XPON Multiplexer, and transceivers—designed for high-speed, scalable fiber access networks. Passive optical networking (PON), like active optical networking, uses fiber-optic cabling to provide Ethernet connectivity from a main data source to endpoints. This prevents electromagnetic interference from external devices and lightning. We can provide customized chip, for example, 4ch 20nm CWDM for WDM-ROSA chip. NTT Innovative Devices' WDM-PON Athermal AWG (Arrayed Waveguide Grating) covers both C-band and L-band simultaneously by cyclic property. This dual band operation can be used for upstream and downstream of the access. In the relentless drive towards faster, more reliable broadband, Passive Optical Networks (PON) stand as the cornerstone of modern Fiber-to-the-Home (FTTH) deployments. At the heart of every PON system lies a critical, yet often overlooked component: the PON module.
