

Principle of Fiber Optic Coaxial Displacement Sensors

Overview

With respect to intensity of light reflected from its displacement of the target is measured. DISPLACEMENT SENSOR (EXTRINSIC SENSOR) Principle: Light is sent through a transmitting fiber and is made to fall on a moving target. The reflected light from the target is sensed. A fiber coaxial displacement sensor based on the chromatic confocal method has been released that replaces the triangulation distance measurement method that has been the mainstay of displacement sensors. Think of it like a photoresistor, which changes its resistance based. Radiation absorption excites an orbital electron to a higher energy level. Heating the material enables the trapped states to interact with phonons and decay into lower-energy. tremely low detection limit and non-contact properties. However, this technique is quite co plicated although it can provide very good sensitivity. Alternatively. The cores are divided into the following types: The core of the plastic-fiber consists of one or more acrylic-resin fibers 0.
