

Requirements for the cover plate of the distribution box beam

Overview

Length of a cover plate should be at least twice the beam depth plus 3 ft. The use of cover plates in regions of high moment allows the use of a section of lesser weight and lesser flexural capacity to be used as the primary beam. This may. Composite beam design/check consists of calculating the flexural, axial, and shear forces or stresses at several locations along the length of a member, and then comparing those calculated values with acceptable limits. That comparison produces a demand/capacity ratio, which typically should not. of structural steel elements for buildings. Worked examples are presented where appropriate. The body of the boxes shall have sufficient reinforcement with suitable size of channels keeping a provision for fixing and conforming to general. Terms are as defined in Figure A6 and Table A5 in DESIGN CHECK NO. plates (discussed in Section 5.
