

# The network speed of the second-stage optical splitter is very slow

## Overview

The same 1Gbps port with a 1:64 splitter drops to ~15Mbps per subscriber—insufficient for households with multiple devices. The splitting process introduces signal attenuation, making placement strategy critical for network performance. In the backbone of modern Fiber-to-the-Home (FTTH) networks, optical splitters serve as the unsung heroes that enable cost-efficient connectivity for millions of subscribers. By dividing a single optical signal from a central Optical Line Terminal (OLT) into multiple outputs for Optical Network. The Fused Biconical Taper (FBT) splitters are fabricated by heating 2 optical fibers until they coalesce into a composite waveguiding structure. While the fibers are being heated, they are slowly stretched and tapered. For instance, a 1:8 splitter ratio signifies an. A fiber broadband provider typically determines and overall split ratio for the network, such as 1x32 or 1x64, and uses combinations of splitters to meet that ratio with each PON port.
