

The optical modules at both ends are different models

Overview

Single fiber modules (BiDi) use one fiber for both transmitting and receiving data. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa. An. Whether you're designing a short-range data center network or a long-distance metro backbone, understanding the distinctions between single vs. However, the basic structure of an optical module includes some common parts, as shown in Figure 1-2. Figure 1-2 Appearance and structure of an optical module (using an SFP optical module as an example). The optical module, known as Optical Transceiver in English, is a general term for various module categories, including optical receiver modules, optical transmitter modules, optical transceiver modules, and optical forwarding modules. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. To meet the demands of various transmission rates, different-rate optical modules have emerged:
