

# What is the appropriate length for network patch cables in a 42u server rack

## Overview

Server racks or data centers: 0.3m to 2m patch cables maintain short, organized runs between patch panels and switches. Inter-rack connections: 5m to 15m cables are suitable for linking equipment across racks or cabinets. As I'm going about making new cables and replacing existing ones, I'm wondering if there are any sorts of best practice methods for determining the exact cable length needed in server rooms besides obviously just using a measuring tape. I'm taking a measuring tape and trying to determine how long. "Alright, each of these blades will need four cables up to this switch, that's 8U vertically, plus room to go over to the vertical cable channel, then back over to the switch. Shortest possible cable run is 22", longest possible is 48". 6" lacing strip) mounted on side rails — they reduce cable stress, improve airflow, and cut troubleshooting time by up to 40% in high-density.
